Education

University of South Florida, College of Engineering Tampa, FL
Bachelor of Science in Computer Science; GPA: 3.56/4.00 *Graduation: December 2026*

- Relevant Coursework: Data Structures & Algorithms, Database Systems, Computer Architecture, Operating Systems
- USF Green & Gold Presidential Waiver Award

Work Experience

Software Engineering Intern May 2026 – August 2026
Maya Software Studio, subsidiary of Mayasoft building fintech services for banking clients

- Proposed and built the risk-decisioning system that let partner banks evaluate merchant loans without direct access to internal data, integrating an ML scoring engine across 35,000+ terminals and 15,000+ merchants to cut bank lending decisions from 7–10 business days to minutes
- Optimized the underlying risk-scoring data pipeline and REST APIs using Python, Java, Spring Boot, SQL, and PostgreSQL, reducing computation from 106 s to 3 s and query latency to 5–7 ms P95

Software Engineer February 2023 – September 2024
Mayasoft, MARTA SoftPOS platform enabling Android devices to accept Visa/Mastercard payments

- Built a centralized transactions dashboard using React, Spring Boot REST APIs, and PostgreSQL to replace manual Excel-based merchant reporting, giving the team real-time visibility into 20,000+ daily transactions and letting them investigate and reconcile disputes without manual spreadsheet work
- Owned merchant onboarding end to end, building document-upload and identity-verification workflows using React, AWS S3, and PostgreSQL with validation, state tracking, and audit history, cutting manual review by 40%

Projects

AI Language Learning Platform | Live | GitHub | *React, TypeScript, Spring Boot, PostgreSQL, Redis, Claude API*

- Built and shipped a full-stack, multilingual AI tutoring platform (React, TypeScript, Spring Boot, PostgreSQL) with JWT authentication and role-based access, serving 300+ daily active users
- Designed a two-layer response caching system using Redis with an in-memory fallback, keyed on request context to reduce redundant Claude API calls; added input sanitization and rate limiting across AI-facing endpoints

HTTP Tunneling Tool | GitHub | *Go, Python, WebSockets, HTTP*

- Built a self-hosted tunneling service (Go server, Python client) that exposes local applications through generated subdomains, using a custom WebSocket protocol and thread-safe subdomain routing
- Achieved approximately 7 ms average latency via Go goroutines and channels for concurrent request handling, using request-ID correlation to prevent response mismatches across simultaneous connections

Distributed Rate Limiter Service | GitHub | *Java, Spring Boot, Redis, Lua, Docker, Prometheus, Kubernetes, k6*

- Built a distributed token-bucket rate limiter (Java, Spring Boot, Redis, Lua) sustaining 7,500 req/sec at 11 ms P95 latency under k6 load testing, with 100% of responses returning correct 200/429 results
- Containerized with Docker and instrumented with Prometheus and Grafana for real-time throughput and latency monitoring; includes Kubernetes manifests for cluster deployment

Leadership

Community Lead July 2026 – Present
Google Developers Student Group, University of South Florida

- Led events for 200+ students, including hackathons and technical workshops, coordinating with the leadership board and communicating engineering concepts to technical and non-technical audiences

Technical Skills

Languages: Java, Python, Go, TypeScript, JavaScript, SQL, C/C++
Frameworks & Data: React, Spring Boot, PostgreSQL, Redis, RabbitMQ
Cloud & DevOps: AWS (EC2, S3), Docker, Kubernetes, Prometheus, Grafana, GitHub Actions, Linux
Tools: Claude API, WebSockets, k6, Maven, Jira, GitHub
